## Example 1

- Let  $f_1, f_2$  be OWFs
- Is  $F(x) = (f_1(x), f_2(x))$  necessarily a OWF?
- No!
- Let  $g$  be a OWF, and define  $f_1(x_1, x_2) = g(x_1), x_2 \rightarrow f_1$  is a OWF
- Similarly,  $f_2(x_1, x_2) = x_1, g(x_2) \rightarrow f_2$  is a OWF
- $F(x) = F(x_1, x_2) = (f_1(x), f_2(x)) = (g(x_1), x_2, x_1, g(x_2)) \rightarrow$  not a OWF
- Still need to prove why  $f_1, f_2$  are OWFs

## Example 2

- Consider the following key-exchange protocol:
  - Alice chooses  $k, r \leftarrow \{0,1\}^n$  at random, and sends  $s := k \oplus r$  to Bob
  - Bob chooses  $t \leftarrow \{0,1\}^n$  at random and sends  $u := s \oplus t$  to Alice
  - Alice computes  $w := u \oplus r$  and sends  $w$  to Bob
  - Alice outputs  $k$  and Bob computes  $w \oplus t$
- a) Show that Alice and Bob output the same key
- b) Show that the scheme is not secure  
*(Reminder) Secrecy:* Given the public information and all the communication exchanged during the execution of the protocol, computing the shared key is computationally hard.

## Example 2

- Alice outputs  $k$
- Bob outputs:

$$\begin{aligned}w \oplus t &= (u \oplus r) \oplus t = ((s \oplus t) \oplus r) \oplus t = \\ &(((k \oplus r) \oplus t) \oplus r) \oplus t = k\end{aligned}$$

## Example 2

- The scheme is not secure.
- Given a transcript  $(s, u, w)$  of the protocol, an adversary can compute:

$$s \oplus u \oplus w = (k \oplus r) \oplus u \oplus (u \oplus r) = k$$

## Example 3

משרד התקשורת הציע להפעיל שירות לתיאום מפתחות הצפנה (להלן שלמה) שיפעל בצורה הבאה. שלמה בוחר זוג ראשוניים גדולים מאד  $p, q$  ומפרסם את מכפלתם  $N = pq$ . כשאלים ובוב רוצים לתאם מפתח משותף, כל אחד מהם מגריל מספר  $1 < r < N$  מקרי – אלים את  $r_A$  ובוב את  $r_B$  – מעלה אותו בחזקת  $e = 3$  מודולו  $n$  ושולח לשלמה. שלמה מקבל את  $r_A^3 \bmod N$  ואת  $r_B^3 \bmod N$ , מפענח אותם, ושולח לאלים ולבוב את  $r_A + r_B \bmod N$ . כעת אלים ובוב יודעים שניהם גם את  $r_A$  וגם את  $r_B$  ויכולים לחשב מפתח משותף  $K = \text{AES}_{r_A}(r_B)$ .

כדי להבטיח הגנה מלאה למשתמשים, שלמה שומר אצלו מאגר ביומטרי עם כל השאילתות שנשלחו אליו אי פעם ומסרב לענות פעמיים על אותה שאילתה (כלומר: אם, למשל, שולחים אליו את  $r_A^3 \bmod N$  פעם נוספת, הוא מחזיר שגיאה).

מנחם המאזין שמע את  $r_A^3$  ואת  $r_B^3$  ורוצה לחשב את  $K$ . הסבירו כיצד הוא ושותפתו למזימה, שפרה, יכולים לנצל את שלמה למטרה זו.

## Example 3

- Menachem can choose a random  $k \neq 0,1, k \in \mathbb{Z}_N$
- He can send  $k^3 \cdot r_A^3 \bmod M$  to Shlomo
- Shifra sends  $k^3 \bmod N$  to Shlomo
- Shlomo sends back  $k \cdot r_A + k$  from which it is easy to compute  $r_A$

## Example 4

- A Sudoku game is a  $n \times n$  board partially filled out with numbers  $1 \dots n$

	9			8		4		
		2		4	1			5
3							6	
	1							
7	6			2			1	9
							8	
	2							8
5			2	9		3		
		4		5			2	

- The goal is to fill out the rest of the board with numbers  $1 \dots n$  such that every row, column and the sub-boxes all have exactly one of each digit in them

## Example 4

- Consider the following ZK proof between a prover  $P$  that holds a solution  $Sol$  to a verifier  $V$ :

1.  $P \rightarrow V$ : Chooses a random permutation  $\sigma: [n] \rightarrow [n]$  and sends to  $V$  a commitment  $c = COM(\sigma(Sol))$
2.  $V \rightarrow P$ : Picks at random row/column/sub-box
3.  $P \rightarrow V$ : Reveals the commitment to the cells
4.  $V$  accepts iff the values of the cells are different

- a) Show soundness and completeness

## Example 4

- Consider **better** ZK proof between a prover  $P$  that holds a solution  $Sol$  to a verifier  $V$ :

- $P \rightarrow V$ : Chooses a random permutation  $\sigma: [n] \rightarrow [n]$  and sends to  $V$  a commitment  $c = COM(\sigma(Sol))$
- $V \rightarrow P$ : Flips a coin  $b \in \{0,1\}$ 
  - $b = 0 \rightarrow$  Picks at random row/column/sub-box
  - $b = 1 \rightarrow$  Asks for the commitment to the known values on the board
- $P \rightarrow V$ : Reveals the requested commitment
- $V$  accepts iff the values of the cells are different/a valid permutation

b) Show soundness and completeness

## Example 4

- Consider **better** ZK proof between a prover  $P$  that holds a solution  $Sol$  to a verifier  $V$ :

1.  $P \rightarrow V$ : Chooses a random permutation  $\sigma: [n] \rightarrow [n]$  and sends to  $V$  a commitment  $c = COM(\sigma(Sol))$
2.  $V \rightarrow P$ : Flips a coin  $b \in \{0,1\}$ 
  - $b = 0 \rightarrow$  Picks at random row/column/sub-box
  - $b = 1 \rightarrow$  Asks for the commitment to the known values on the board
3.  $P \rightarrow V$ : Reveals the requested commitment
4.  $V$  accepts iff the values of the cells are different/a valid permutation

c) Show a simulator

## Example 5

- Let  $COM_1, COM_2$  be two commitment schemes
- Both schemes are binding
- However, one of them is not hiding
- To solve the problem, one constructed a new commitment scheme:
- $COM(M) = COM_1(M), COM_2(M)$
  
- Is  $COM$  secure?
- No!
- Let  $COM_1(M) = M$  and  $COM_2$  some secure (hiding, binding) scheme
- $COM(M) = M, COM_2(M) \rightarrow$  not hiding

## Example 6

- Let  $p = 3 \pmod 4$  prime
- Let  $a \in QR(\mathbb{Z}_p^*)$
- Show that  $a^{\frac{p+1}{4}}$  is a square root of  $a$
- Let  $g$  be a generator,  $a = g^{2i} \pmod p$
- $\left(a^{\frac{p+1}{4}}\right)^2 = a^{\frac{p+1}{2}} = g^{2i\left(\frac{p+1}{2}\right)} = g^{i(p-1)+2i} = g^{2i} = a \pmod p$
- Finding a square root over  $\mathbb{Z}_p^*$  is easy for any prime  $p$

## Example 7

- Let  $p = 3 \bmod 4$  prime
- Let  $g$  be a generator in  $Z_p^*$
- Define the following problems:
  - **Mult**: given  $(p, g, g^x, g^y)$   $\rightarrow$  compute  $g^{xy}$
  - **Square**: given  $(p, g, g^x)$   $\rightarrow$  compute  $g^{x^2}$
- Let  $A_{mult}$  be an algorithm that given  $(p, g, g^x, g^y)$  returns  $g^{xy}$  w.p 1
- Show an algorithm  $A_{square}$  that given  $(p, g, g^x)$  returns  $g^{x^2}$  w.p 1

## Example 7

- Let  $p = 3 \pmod 4$  prime
- Let  $g$  be a generator in  $Z_p^*$
- Define the following problems:
  - **Mult**: given  $(p, g, g^x, g^y)$   $\rightarrow$  compute  $g^{xy}$
  - **Square**: given  $(p, g, g^x)$   $\rightarrow$  compute  $g^{x^2}$
- $A_{square}$  that is given  $(p, g, g^x)$ :
  1. Run  $A_{mult}$  on  $(p, g, g^x, g^x)$  and get  $g^{x \cdot x} = g^{x^2} \pmod p$

## Example 7

- Let  $p = 3 \bmod 4$  prime
- Let  $g$  be a generator in  $Z_p^*$
- Define the following problems:
  - **Mult**: given  $(p, g, g^x, g^y)$   $\rightarrow$  compute  $g^{xy}$
  - **Square**: given  $(p, g, g^x)$   $\rightarrow$  compute  $g^{x^2}$
- Let  $A_{square}$  be an algorithm that given  $(p, g, g^x)$  returns  $g^{x^2}$  w.p 1
- Show an algorithm  $A_{mult}$  that given  $(p, g, g^x, g^y)$  returns  $g^{xy}$  w.p 1

## Example 7

- Let  $p = 3 \pmod 4$  prime
- Let  $g$  be a generator in  $Z_p^*$
- Define the following problems:
  - **Mult**: given  $(p, g, g^x, g^y)$   $\rightarrow$  compute  $g^{xy}$
  - **Square**: given  $(p, g, g^x)$   $\rightarrow$  compute  $g^{x^2}$
- $A_{mult}$  that is given  $(p, g, g^x, g^y)$ :
  1. Run  $A_{square}$  on  $(p, g, g^x)$  and get  $g^{x^2} \pmod p$
  2. Run  $A_{square}$  on  $(p, g, g^y)$  and get  $g^{y^2} \pmod p$
  3. Run  $A_{square}$  on  $(p, g, g^{x+y})$  and get  $g^{(x+y)^2} \pmod p$
  4. Compute  $\frac{g^{(x+y)^2}}{g^{x^2} \cdot g^{y^2}} = g^{2xy}$  and find its square root
