# One Way Function (OWF)

*Definition.* A function  $f: \{0,1\}^n \rightarrow \{0,1\}^m$  is a  **$\varepsilon$ -one way function ( $\varepsilon$ -OWF)** if for any polynomial time adversary  $A$ :

$$\Pr_{x \leftarrow \{0,1\}^n} [A(f(x)) = x] < \varepsilon$$

- What if  $f$  is not one-to-one?
- What is  $\varepsilon$ ?

## DL $\rightarrow$ OWF

*Definition. The discrete logarithm problem:*

Let  $G$  be a cyclic group of order  $|G| = m$  and a generator  $g \in G$ .

Given:  $h = g^x$  for  $x \in \mathbb{Z}_m = \{0, \dots, m - 1\}$

Output:  $x$  such that  $g^x = h$

*Definition. The discrete logarithm assumption:*

There exists a cyclic group  $G$  for which the DL problem is hard

- Let  $p$  be a prime and a generator  $g \in \mathbb{Z}_p^*$  (in which DL is hard)
- Define the OWF:  $f(x) = g^x \bmod p$

# Hard-Core Predicates

- Motivation:
  - A OWF  $f$  is hard to invert
  - Given  $f(x)$ , the value of  $x$  is hard to discover
  - However, a OWF  $f$  may disclose some information about its input
- Example:
  - Let  $f$  be a OWF
  - Define  $g(x_1, x_2) = (f(x_1), x_2)$
  - $g$  is also a OWF, and in the same time reveals  $x_2$  completely

# Hard-Core Predicates

*Claim.* If  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  is a OWF, then  $g: \{0,1\}^{n+1} \rightarrow \{0,1\}^{n+1}$   
 $g(x_1, x_2) = (f(x_1), x_2)$  is also a OWF

- Assume  $g$  is not a OWF
- Then, there exist an efficient adversary  $A_g$  such that
$$\Pr_{x_1 \leftarrow \{0,1\}^n, x_2 \leftarrow \{0,1\}} [A_g(g(x_1, x_2)) = x_1, x_2] > \varepsilon$$
- We'll construct an efficient adversary  $A_f$  that inverts  $f$  w.p.  $> \varepsilon$

1. The adversary  $A_f$  is given  $f(x)$
2.  $A_f$  chooses at random  $u' \leftarrow U_1$
3.  $A_f$  runs  $A_g((f(x), u'))$  and returns the first  $n$  bits of the output

# Hard-Core Predicates

- A hard-core predicate of a function  $f$  is:
  - A function  $hc: \{0,1\}^n \rightarrow \{0,1\}$  such that:
  - Given  $f(x)$  it is hard to guess  $hc(x)$  w.p.  $> \frac{1}{2} + \varepsilon$

*Definition.* A polynomial-time computable predicate  $hc: \{0,1\}^n \rightarrow \{0,1\}$  is called a hard-core of a function  $f$  if for every PPT algorithm  $A$ :

$$\Pr_{x \leftarrow \{0,1\}^n} [A(f(x)) = hc(x)] \leq \frac{1}{2} + \varepsilon$$

- $hc(x)$  is called the hard core bit (HCB)

# Hard-Core Predicates

*Definition.* A polynomial-time computable predicate  $hc: \{0,1\}^n \rightarrow \{0,1\}$  is called a hard-core of a function  $f$  if for every PPT algorithm  $A$ :

$$\Pr_{x \leftarrow \{0,1\}^n} [A(f(x)) = hc(x)] \leq \frac{1}{2} + \varepsilon$$

*Equivalent Definition.* A polynomial-time computable predicate  $hc: \{0,1\}^n \rightarrow \{0,1\}$  is called a hard-core of a function  $f$  if

$$f(U_n), hc(U_n) \approx_{c,\varepsilon} f(U_n), U_1$$

# Hard-Core Predicates

- We'll show one direction:

$$f(U_n), hc(U_n) \approx_{c,\varepsilon} f(U_n), U_1 \rightarrow$$

for every PPT algorithm  $A$ ,  $\Pr_{x \leftarrow \{0,1\}^n} [A(f(x)) = hc(x)] \leq \frac{1}{2} + \varepsilon$

- Assume there exists a PPT algorithm  $A_1$  such that

$$\Pr_{x \leftarrow \{0,1\}^n} [A_1(f(x)) = hc(x)] > \frac{1}{2} + \varepsilon$$

- Construct the following PPT  $A_2$

1.  $A_2$  is given  $(u, b)$  (either from  $(f(U_n), hc(U_n))$  or  $(f(U_n), U_1)$ )
2.  $A_2$  returns  $1 \iff A_1(u) = b$

# Hard-Core Predicates

- Construct the following PPT  $A_2$

1.  $A_2$  is given  $(u, b)$  (either from  $(f(U_n), hc(U_n))$  or  $(f(U_n), U_1)$ )
2.  $A_2$  returns  $1 \iff A_1(u) = b$

- Let's analyze the result:

- $$\left| \underbrace{\Pr_{d_0 \leftarrow f(U_n), hc(U_n)} [A_2(d_0) = 1]}_{> \frac{1}{2} + \varepsilon} - \underbrace{\Pr_{d_1 \leftarrow f(U_n), U_1} [A_2(d_1) = 1]}_{= \frac{1}{2}} \right| > \varepsilon$$

# Hard-Core Predicates

- Let's try  $hc(x) = \bigoplus_{i=1}^n x_i$  where  $x = x_1x_2 \dots x_n$
- Is this a HCP for every OWF function  $f$ ?
  - No!
- Let  $f$  be a OWF
- Define  $g(x) = (f(x), \bigoplus_{i=1}^n x_i)$
- $g$  is also a OWF, and at the same time reveals  $hc(x)$  completely

# Goldreich-Levin Theorem

- Every OWF can be trivially modified to obtain a OWF that has a specific hard-core predicate

## OWP $\rightarrow$ PRG

*Theorem.* Let  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  be a OWP and let  $hc$  be a hard-core predicate of  $f$ .

Define  $G: \{0,1\}^n \rightarrow \{0,1\}^{n+1}$  as follows:  $G(s) = (f(s), hc(s))$ .

Then,  $G$  is a PRG.

## Reminder: DL $\rightarrow$ OWF

- Let  $p$  be a prime and a generator  $g \in \mathbb{Z}_p^*$  (in which DL is hard)
- Define the OWF:  $f(x) = g^x \text{ mod } p$

## HCB for: DL $\rightarrow$ OWF

- Let  $p$  be a prime and a generator  $g \in \mathbb{Z}_p^*$  (in which DL is hard)
- Define the OWF:  $f(x) = g^x \text{ mod } p$
  
- First attempt:
- $hc(x) = \text{parity}(x) = x \text{ mod } 2$
- We will prove in HW that this function is not a HCP
  
- Blum-Micali (without proof):
- Define  $Half(x) = \begin{cases} 1 & x \in \left[1, \frac{p-1}{2}\right] \\ 0 & \text{otherwise} \end{cases}$

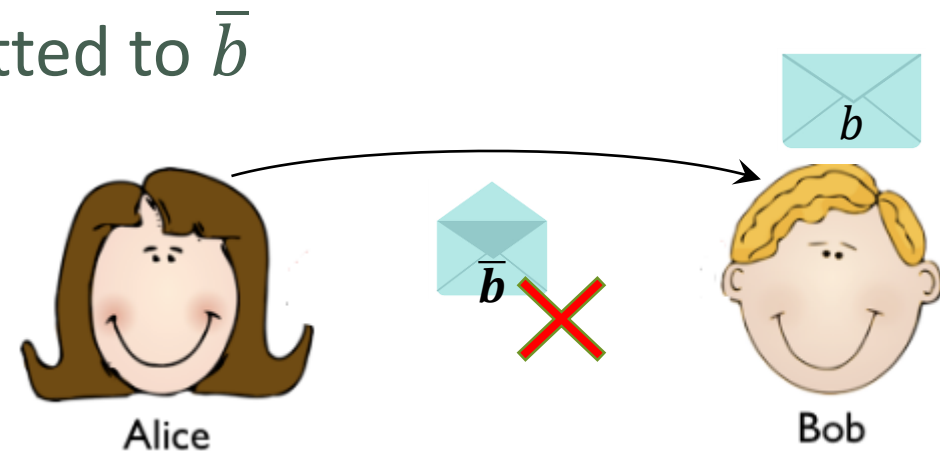

# Bit Commitment

- A two party protocol between computationally bound Alice and Bob
- Alice **commits** to a bit  $b$  (which she chooses)
- Bob cannot tell what  $b$  is after the commitment phase
- At a decommit phase, Alice **reveals**  $b$ , and Bob is convinced this is indeed the bit Alice committed to

# Bit Commitment

- A two party protocol between computationally bound Alice and Bob
- Alice **commits** to a bit  $b$  (which she chooses)
- Bob cannot tell what  $b$  is after the commitment phase
- At a decommit phase, Alice **reveals**  $b$ , and Bob is convinced this is indeed the bit Alice committed to
- Alice cannot convince Bob she committed to  $\bar{b}$

# Bit Commitment

- Commit Stage:
  - The sender  $S$  (Alice) has private input  $\sigma \in \{0,1\}$
  - $S$  chooses a private random input  $r$
  - $S$  sends to the receiver  $R$  (Bob) the commitment  $C(\sigma, r)$
- Decommit Stage:
  - $S$  sends  $\sigma, r$  to  $R$
  - $R$  either accepts or rejects
- Hiding property:  $\forall \sigma_1, \sigma_2 \in \{0,1\}. C(\sigma_1, r) \approx_{\epsilon} C(\sigma_2, r)$
- Binding property:  $\nexists \sigma_1, r_1, \sigma_2, r_2$  s.t  $C(\sigma_1, r_1) = C(\sigma_2, r_2)$  and  $\sigma_1 \neq \sigma_2$

## OWP $\rightarrow$ Bit Commitment

- Let  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  be a OWP with a HCP  $hc: \{0,1\}^n \rightarrow \{0,1\}$
- Commit Stage:
  - The sender  $S$  has private input  $\sigma \in \{0,1\}$
  - $S$  chooses a private random input  $r \leftarrow \{0,1\}^n$
  - $S$  sends to the receiver  $R$  the commitment  $C(\sigma, r) = (f(r), hc(r) \oplus \sigma)$
- Decommit Stage:
  - $S$  sends  $\sigma, r$  to  $R$
  - $R$  verifies the correctness either accepts or rejects
- ✓ Binding property:  $\nexists \sigma_1, r_1, \sigma_2, r_2$  s.t  $C(\sigma_1, r_1) = C(\sigma_2, r_2)$  and  $\sigma_1 \neq \sigma_2$
- ✓ Hiding property:  $\forall \sigma_1, \sigma_2 \in \{0,1\}. C(\sigma_1, r) \approx_{c,\varepsilon} C(\sigma_2, r)$

# OWP $\rightarrow$ Bit Commitment

- Let  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  be a OWP with a HCP  $hc: \{0,1\}^n \rightarrow \{0,1\}$
- Commit Stage:
  - The sender  $S$  has private input  $\sigma \in \{0,1\}$
  - $S$  chooses a private random input  $r \leftarrow \{0,1\}^n$
  - $S$  sends to the receiver  $R$  the commitment  $C(\sigma, r) = (f(r), hc(r) \oplus \sigma)$
- Decommit Stage:
  - $S$  sends  $\sigma, r$  to  $R$
  - $R$  verifies the correctness either accepts or rejects
- ✓ Binding property:  $\nexists \sigma_1, r_1, \sigma_2, r_2$  s.t  $C(\sigma_1, r_1) = C(\sigma_2, r_2)$  and  $\sigma_1 \neq \sigma_2$
- ✓ Hiding property:  $\forall \sigma_1, \sigma_2 \in \{0,1\}. C(\sigma_1, r) \approx_{c, \epsilon} C(\sigma_2, r)$

tradeoff

# Coin Flipping Over the Phone

- Let  $f: \{0,1\}^n \rightarrow \{0,1\}^n$  be a OWP with a HCP  $hc: \{0,1\}^n \rightarrow \{0,1\}$
- Let  $C(x, r) = (f(r), hc(r) \oplus x)$

Alice

1. Alice chooses a random bit  $x$  and sends  $C(x, r)$

2. Bob chooses a random bit  $x'$  and send it to Alice

3. Alice sends  $x, r$

Bob

The outcome of the coin flip is  $x \oplus x'$
